

## Banner 8 eviadm.pc

### Why it is Needed

One of the big changes in Banner 8 was Internationalization. This required the processes to use Unicode rather than the standard ASCII text. The previous version of eviadm.pc did not have the Unicode functions added to the file as they were not needed in Banner 7. Evisions has re-written this file to include the new Unicode functions so it will work properly in Banner 8.

### How to Install

While previous versions of FormFusion may work on Banner 8, Evisions strongly recommends all users use the latest version of FormFusion on Banner 8.

The new version of eviadm.pc can be downloaded at:

[http://www.evisions.com/web\\_client\\_files/B8/eviadm.pc](http://www.evisions.com/web_client_files/B8/eviadm.pc)

In step 4 of the Installation Instructions, step 3 of the Upgrade Instructions, the user is instructed to use eviadm.pc. The instructions have the user navigate to the \server folder of FormFusion and ftp eviadm.pc to the Banner server.

Banner 8 users should use the eviadm.pc from the link above, not the version found in the \server directory. The rest of the steps in the instructions can be followed as normal.

If you run into any problems or have any questions please submit a ticket to our helpdesk at <http://helpdesk.evisions.com>.
